

NexusRAG Test Enterprise Document

Document Version: 2.0 | Year: 2026

1. Document Overview

This sample document is created specifically to test the NexusRAG Phase 1 document ingestion pipeline. It contains multiple sections and a table so that text extraction, page metadata, section detection, and chunking can be verified.

2. Processing Policy

Uploaded enterprise documents should be validated, processed, assigned a unique document identifier, enriched with metadata, and divided into traceable chunks. Each chunk should retain information about its source document and page whenever available.

3. Sample Records

Item	Category	Status	Year
Policy Manual	Compliance	Active	2026
Operations Guide	Operations	Active	2026
Security Standard	Security	Review	2025

4. Expected Ingestion Metadata

The ingestion pipeline should preserve document name, file type, upload timestamp, page number, section title, version, and year where these values can be detected. Missing metadata should be represented safely rather than causing processing failures.
